Jiva.ai and Incubate bio enter a Strategic Collaboration to Advance Personalized Medicine

Jiva.ai and Incubate bio will integrate their software platforms, bringing together multimodal AI and causal simulation. This will enable clinicians to both identify risk factors and then explore the mechanisms behind complex diseases.

[London, April 3, 2023]. Jiva.ai and Incubate bio announced today that the companies have entered into a strategic partnership that will enable clinicians to identify risk factors and then explore the mechanisms behind complex diseases.

“Clinicians are eager to tap the benefits that AI algorithms offer, but the software systems need to be simple to use and actionable in their workflows.” said Dr Manish Patel, CEO, Jiva.ai. “To achieve end-to-end insights for clinicians, we are excited to partner with Incubate bio, integrating our AI platform with their ALASCA platform.”

“Manish and his team have built a powerful, flexible AI platform. Their platform finds the ‘what’, and ALASCA enables the clinicians to explore the ‘why’ and ‘how’ using a novel causal simulation method.” said Dr Raminderpal Singh, CEO, Incubate bio.

Multimodal AI offers rapid insights on what risk factors are influencing the progression of disease in patients. ALASCA adds a second critical step, by enabling a way for clinicians to explore why and how those prioritized risk factors are influencing disease progression.

About Incubate bio

Incubate bio is revolutionizing how R&D scientists explore and simulate effects during preclinical phases. Incubate bio's platform, ALaSCA (patent pending), uses formal causal methods to untangle the pivots and redundancies within biological pathways - thereby enabling the identification of the optimal nodes for drug and other treatment interventions, and improving the efficiency of targeting for any phenotypic (disease) process. To learn more about ALaSCA and a Type 1 Diabetes case study:

About Jiva.AI

Jiva.ai is an AI company offering multimodal, explainable AI solutions at scale in a no-code environment. This empowers non-technical users to iteratively create, validate, test and deploy models based on their data for real-world use. We are primarily focused on healthcare.
